# Argentina's Market

## Argentina's key variables

53,19 % internet access	0,24 AVG revenue USD M
6,56 internet speed mbps	0,29 HHI

The Herfindahl-Hirschman Index (**HHI**) is a way to measure how competitive or concentrated a market is. It is calculated by summing the squares of each company's market share expressed as a decimal.

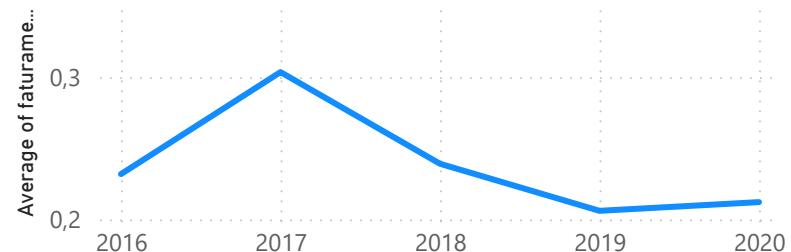

- If the HHI is close to 0, the market is very competitive, with many companies holding small shares

The forecasts do not perform well because they are not capable of capturing sudden, non-linear changes in the exchange rate. This is a common limitation of many forecasting models, which tend to work better with stable or predictable trends.
